

LI-ION BATTERY STORAGE AND MAINTENANCE

Keep the battery at a **maximum temperature of 35 ° C** - the battery warms up to a similar temperature during operation.

If your battery has a built-in display - **turn it off**. This will prevent the battery from discharging too quickly.

After bringing the battery out of frost, **do not keep it, for example, in a plastic bag**, because the air can condense and the battery can rot.

Store a battery **charged up to 40-50%** - you can check the level of charge on the display or using the LEDs on the housing.

Proper battery handling **significantly extends its service life and performance!**
